
Proteus and usb

Posted by Proteus 7.4 and usb - 2009/05/23 19:26

thanks for the excellent artical.

I tried the circuit (40pin) with Proteus 7.4 and windows asked me driver and everything was ok.

But when I tried on the breadboard after adding the 4.7k resistor , all four leds were ligit up and Windows pop up "device unrecognized" and at each time the pic warm up. I haven't used a connector on pic side.

When I try reprogram the pic , I couldnt program the pic.

I solved the problem. It was because of wrong connection. It is ok now.:P
